Food Matrix Reference Materials

This brochure provides a comprehensive list of food matrix reference materials from various manufacturers, sorted by matrix type and listing the analytes to make it quick and easy for you to find the material that is fit for your needs.

Matrix reference materials are important tools for an analytical laboratory to develop, validate, and verify the results of their analytical methods. While reference materials in neat or in solution formats are usually used for calibration or identification purposes of specific analytes, matrix materials take matrix effects too into account and can serve to account for the bias during sample workup and preparation. Matrix materials are characterised for their composition of specified major, minor, or trace chemical constituents. The material can be naturally contaminated, or the samples can be fortified by spiking the analytes of interest to a blank matrix.

The closer the nature of the used matrix material is to the tested samples, the better it can help to validate the results of a method.

Manufacturing of Food Matrix Reference Materials is a very laborious and time-consuming process. Most of the Food Matrix Materials currently available in the market are manufactured either by metrological institutes (like the National Institute of Standards and Technology (NIST) or the European Joint Research Center (JRC)) or by proficiency testing (PT) providers with access to a big set of analytical data from accredited labs.

Our offering of more than 200 food matrix materials includes products from NIST, JRC, METAS, FAPAS, Alpha Resources and Elemental Microanalysis.

This brochure aims to help you finding the best suited matrix material, but we are only listing the analytes, not the certification level and values. Please also note, that certification of materials as well as the range of certified analytes might be changing. Therefore we recommend to check the most current certificate which you can usually find linked at the corresponding product pages

NIST

Founded on March 3, 1901, the National Institute of Standards and Technology (NIST) in the United States is one of the oldest physical science laboratories globally. Its measurements support the smallest of technologies to the largest and most complex of human-made creations. NIST standards, also called standard reference materials (SRMs), are available for use in various areas such as industrial raw materials, clinical chemistry, environmental analysis, and food and agriculture. We are proud to be a Licensed Distributor of NIST SRMs.

Joint Research Center (JRC)

The Reference Material Unit of the JRC (Joint Research Center, a Directorate General of the European Commission) is situated in Geel, Belgium.

The JRC's mission is to support EU policies with independent evidence throughout the whole policy cycle. This involves the production of certified reference materials (pure and matrix materials) for environmental analysis, food analysis, clinical chemistry, industrial applications and physical properties. The JRC's CRMs are available under the ERM®, EURM®, IRMM® and BCR® brands.

The JRC's CRMs are produced in accordance with ISO 17034 and the JRC holds accreditation to ISO 17034 (reference materials production), ISO/IEC 17025 (testing) and ISO 17043 (proficiency testing).

Fapas®

Fapas® is a renowned provider of proficiency testing schemes for food analysis and is part of Fera, a center of excellence for interdisciplinary investigation and problem solving across plant and bee health, crop protection, sustainable agriculture, food and feed quality and chemical safety in the environment based in York (UK).

The Fapas® RMs are derived from materials used for proficiency testing schemes and undergo formal stability testing for both short-term and long-term applications. The products are delivered with an associated datasheet which lists the reference values and their expanded uncertainty U . The value of U is not a performance limit but is the uncertainty relating to the reference value. RMs therefore have a greater degree of trust in their values than, for example, quality control materials and can be used for method calibration purposes. Fapas® RMs are manufactured in accordance with the principles of ISO 17034.

Alpha Resources and Elemental Microanalysis

Elemental Microanalysis and Alpha Resources are experts in elemental combustion analyses (C, H, N, O, S) within the inorganic and organic markets. Each reference material is manufactured within an ISO9001 accredited company and all Certified Reference Materials (CRM) are produced under ISO17034 accreditation, utilising ISO17025 accredited labs. The determination of certified values for Carbon, Hydrogen, Nitrogen, Oxygen and Sulfur are with elemental analysers calibrated with materials from the National Institute of Standards and Technology (NIST) where applicable. The isotope values are traceable to primary isotopic certified reference materials issued by IAEA Vienna. All reference materials without ISO17034 certification have been produced and tested within a ISO9001 and ISO17025 laboratory.

METAS

The Federal Institute of Metrology METAS serves as the federal centre of competence for all issues related to measurement and for measuring equipment and procedures. It is the Swiss national metrology institute. As such, its mandate is to ensure the availability of measurement and testing facilities with the degree of accuracy needed to meet the requirements of the economy, research and administration. In collaboration with us in Buchs, METAS is developing certified reference materials. An example is the Whey Protein Matrix Material **WP-CBR001**, intended to be used for development, validation and performance control of analytical methods for the determination of toxic elements and polycyclic aromatic hydrocarbons (PAHs)
